Descriptors-\*Achievement Tests, Multiple Choice Tests, Program Descriptions, Test Construction, Testing, \*Testing Programs, Test Interpretation, Test Reliability, Test Validity, \*Trade and Industrial Education Identifiers-\*Ohio Trade and Industrial Education Achievement Test

The Ohio Trade and Industrial Education Achievement Test battery is comprised of seven basic achievement tests: Machine Trades, Automotive Mechanics, Basic Electricity, Basic Electronics, Mechanical Drafting, Printing, and Sheet Metal. The tests were developed by subject matter committees and specialists in testing and research. The Ohio Trade and Industrial: lucation Services, Instructional Materials Laboratory. publishes and distributes the tests and provides the services of scoring, reporting, and evaluating test results. The tests have been continuously revised since 1958. through study of item analyses; content, construct, and predictive validities: reliability coefficients; and standard error of measurements. The trade tests, the Stanford Arithmetic Achievement Test, and the California Survey of Mental Maturity have been normed of the same population to allow generalizations about an individual's intelligence and achievement scores. The multiple-choice questions require the student to solve problems, analyze data, recall specific facts, react to generalizations, use abstractions, and put together parts to form a whole. Administration time for the various tests varies from 4 1/2 to 7 1/2 hours. The test results aid in curriculum reorganization and improvement of instruction, as well as provide information on student achievement. The appendixes provide test profile norms and a list of schools participating in the testing program. (HC)

### THE NATURE AND PURPOSE OF THE

### OHIO TRADE AND INDUSTRIAL EDUCATION TESTS

The Ohio Trade and Industrial Education Achievement Test battery grew out of demands by Ohio educators for instruments which measured success in trade areas. The tests are specially designed instruments for evaluation and diagnosis of vocational achievement.

These tests were originated in 1958, at the Ohio Trade and Industrial Education Local Supervisors' Workshop. Prior to 1963, the distribution of tests was limited to Ohio. However, the states of Illinois, Indiana, Kentucky, West Virginia, Delaware, Utah and the District of Columbia have participated in this program.

### ORGANIZATION OF THE TESTS

The battery is comprised of seven basic achievement tests: Machine Trades, Automotive Mechanics, Basic Electricity, Basic Electronics, Mechanical Drafting, Printing and Sheet Metal.

### Machine Trades

Part I consists of eight sections designed to measure the student's ability to handle: (1) Applied Machine Trade Mathematics (2) Layout (3) Hand Tools (4) Measuring (5) Power Sawing (6) Drilling (7) Shaping and (8) Heat Treating Part I contains 99 items.

Machine Trades Part II is made up of nine sections which are: (1) Machine Trade Science (2) Machining-Lathe (3) Milling (4) Blueprint Reading (5) Grinding-Bench (6) Grinding-Surface (7) Grinding-Tool and Cutter (8) Grinding-Cylindrical and (9) Grinding-Internal. There are 172 items in this section. Automotive Mechanics

Part I contains five sections and 150 items in the following areas:
(1) Engine (2) Fuel System (3) Suspension System (4) Brake and (5) Basic Equipment and Tools.

Part II has six sections and 156 items designed to measure: (1) Automotive Science (2) Cooling System (3) Electrical System (4) Power Train (5) Steering System and (6) General Service.

**Basic Electricity** 

The Basic Electricity test is developed around nine areas and has 240 items concerned with: (1) Direct Current Electricity (2) Laws of Magnetism (3) Alternating Current Electricity (4) Measurement (5) Construction Wiring (6) Diagnosis and Maintenance (7) Circuit Tracing (8) Applied Mathematics and (9) Applied Science.

### Basic Electronics

The Basic Electronics test contains 100 items and eight sections including:

- (1) Tuning Circuits (2) Vacuum Tubes (3) Semiconductor Characteristics
- (4) Power Supplies (5) Amplifiers (6) Detector Circuits (7) Test Equipment and
- (8) Oscillator Circuits.

### Mechanical Drafting

Part I has ten sections and 151 items in the following areas: (1) Drafting Materials and Equipment (2) Dimensioning (3) Auxiliary Views (4) Threads and Fasteners (5) Production or Working Drawing (6) Machine Elements (7) Auxiliary Information (8) Industrial Processes (9) Materials of Industry and (10) Applied Science.

Part II incorporates 99 items in the following eight areas: (1) Orthographic Projection (2) Sectional Views (3) Pictorial Drawing (4) Intersections and Developments (5) Geometric Drawing (6) Lettering (7) Reproduction of Drawings and (8) Functions of Mathematics.

Printing

Part I contains ten sections and 197 items: (1) Orientation (2) Printing Planning (3) Hand Composition (4) Machine Composition (5) Photo Composition

- (6) Camera Operation (7) Film Processing (8) Letterpress Platemaking
- (9) Letterpress Presswork and (10) Applied Science.

Part II has six sections and 143 items concerned with: (1) Lithographic Stripping and Platemaking (2) Lithographic Presswork (3) Binding Work (4) Paper Technology (5) Ink Technology and (6) Applied Mathematics. Sheet Metal

Part I has 144 items covering seven sections: (1) Blueprint Reading

- (2) Applied Science (3) Applied Mathematics (4) Hand Tool Operations
- (5) Machine Operations (6) Soldering and (7) Special Operations.

Part II has 100 items and seven sections: (1) Mechanical Drawing

- (2) Freehand Sketching (3) Metals (4) Non-Metallic (5) Layout Operations
- (6) Fabricating Operations and (7) Welding.

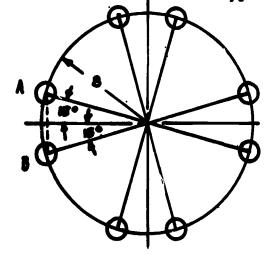

### SAMPLE TEST ITEMS

All questions are multiple choice, with four possible responses; one is correct and the other three are distracters. Examples from the various tests follow:

### Machine Trades - Sample Questions

- A. The center to center distance on a straight line between A and B is (Note: the sine of  $15^{\circ}$ =. 2588) (Formula: Sine of an angle= $\frac{\text{side opposite}}{\text{hypotenuse}}$
- (1) 4.4211
- (2) 4.2411
- (3) 4.4141
- (4) 4.1408

- B. Coolants are used on the milling machine to-
  - 1. cool the work, clear chips and lubricate the tool.
  - 2. dispose of chips and lubricate the machine.
  - 3. clean the work, lubricate the machine, and cool the chip.
  - 4. permit greater clearance on the cutter.

### **<u>Automotive Mechanics</u>** - Sample Questions

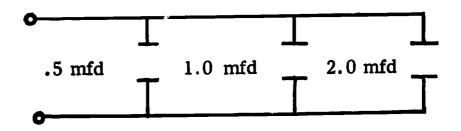

- A. Which symbol is used to indicate a resistor in an electrical circuit?
  - 1. —
- 2.

3. **#** 

- 4. \_\_\_\_
- B. A low reading on a compression test of two adjacent cylinders indicates -
  - 1. blown head gasket.
  - 2. bad valves.
  - 3. burning oil.
  - 4. valves sticking.

### Basic Electricity - Sample Questions

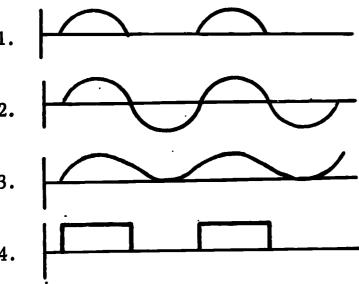

- A. In the circuit illustrated the total capacitance is-
  - 1. 3.5
  - 2. 1.0
  - 3. 0.5
  - 4. 2.0

- B. If an Ohmmeter reads 1000 ohms. and a voltmeter reads 270 volts, there is a current of -
  - 1. .27 amps.
  - 2. 3.7 amps.
  - 3. 370 amps.
  - 4. 2700 amps.

### Basic Electronics - Sample Questions

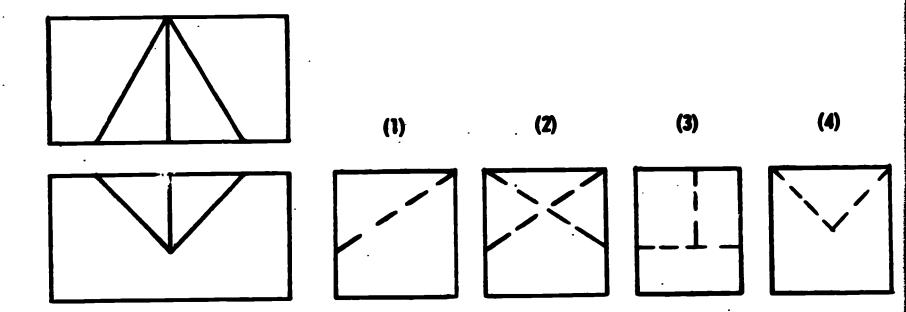

A. A standard pattern found on half wave rectifiers is shown by -

- B. The purpose of chokes and capacitors in a power supply is to -
  - 1. smooth out pulsating D.C. current.
  - 2. step up the voltage.
  - 3. provide various potentials.
  - 4. rectify the voltage.

### Mechanical Drafting - Sample Questions

A. Choose the correct side view.

- B. The reason for an auxiliary view is to show -
  - 1. the slanted surface in its true shape and size.
  - 2. the correct contour of the object.
  - 3. the exact interior of the object.
  - 4. all the parts in true relationship to each other.

### **Printing - Sample Questions**

- A. Most inks dry by a combination of-
  - 1. oxidation and absorption.
  - 2. absorption and emulsification.
  - 3. oxidation and homogenization.
  - 4. absorption and adsorption.
- B. When locking up a form for an automatic cylinder press, the stone man must allow sufficient margin for -
  - 1. gripper bite on gripper edge.
  - 2. half inch trim on all sides.
  - 3. two inch gripper bite . three sides.
  - 4. one-sixteenth inch grippe: bite.

### **Sheet Metal** - Sample Questions

- A. The shears that are specially designed for cutting assembled pipe of various sizes are called-
  - 1. double cutting shears.
  - 2. hawkbill snips.
  - 3. bench shears.
  - 4. compound lever shears.
- B. Because copper has a high rate of expansion, we must, when doing "flashing" work, be careful to avoid-
  - 1. especially long sections.
  - 2. using elastic caulking compound.
  - 3. using 50-50 solder.
  - 4. using galvanized alongside.

### WHAT THE TRADE AND INDUSTRIAL EDUCATION

### TEST BATTERY MEASURES

These tests were developed to measure skills and understanding in specific vocational areas. Students are requested to: (1) solve problems (2) analyze data (3) recall specific facts (4) have a knowledge of principles (5) react to generalizations (6) be able to use abstractions in specific situations and (7) put together parts so as to form a complete structure.

### USES OF THE TEST

Test results should be evaluated in terms of the school's overall objectives and philosophy. A student's test performance begins with the subject area scores and proceeds through the subdivisions of the test. The greatest value of skills testing is found when subscores and item responses are utilized in evaluation and diagnosis.

The Stanford Arithmetic Achievement test, the Ohio T and I Achievement tests and the California Survey of Mental Maturity tests have been normed on the same population; therefore, generalizations can be made about an individual's intelligence and achievement scores. It may be anticipated that an individual's mental age should correspond to his achievement score. The use of the mental ability test result will give the teacher an indication as to how the student is using his mental capacity in a particular vocational area.

### Improvement of Instruction

The test results can be utilized to identify strong and weak areas of instruction, and may indicate a need for some curriculum reorganization.

The lack of equipment, or poor quality of equipment may be identified as a cause for student ineffectiveness.

The trade achievement scores can aid an instructor in the evaluation of the students' performance in relation to the students' intelligence.

The testing program may motivate instructors and students toward higher achievement, and will assist the learning process.

### School and Community Research

Relationships of mental maturity, arithmetic and vocational achievement may support present student selection procedures or indicate a need for changes in selection techniques.

California Survey of Mental Maturity and Stanford Arithmetic achievement scores can be compared with national profiles in group analysis studies.

### **Student Benefits**

The test results will provide information for teachers and counselors for job placement.

The teacher and student will have evaluative information concerning his (the student's) ranking in local and state settings.

Local, state and national awards could be presented on the basis of the test scores.

### **TECHNICAL INFORMATION**

### TEST DEVELOPMENT

Local supervisors of Trade and Industrial Education determine the trade in which a test is to be developed. A committee is then organized to develope a course outline. The committee is comprised of a representative of the state supervisory staff, a teacher-educator, a local supervisor of Trade and Industrial Education, selected teachers of the course, and a representative of the Ohio Trade and Industrial Education Services, Instructional Materials Laboratory. (1) The course outline is comprehensive in listing units of instruction which the committee determines should be offered in the course. (2) The committee developes and reviews questions based on the course outline. (3) The Ohio Trade and Industrial Education Services, Instructional Materials Laboratory compiles, publishes, and distributes the test. They also provide the scoring, the reporting, and the evaluation of test results.

After the first year of use, a test is revised by the committee using item analysis. Each question is reviewed on the basis of types of responses made by students. If the analysis indicates a question is faulty, the item is either replaced or rewritten.

### **VALIDITY**

The items selected for use in the Ohio T and I Achievement tests have been selected from a general pool of items. Item analysis data, which yield discrimination values and difficulty level, have been produced for each item. Based on this information, final forms of each test have been developed. These items are constantly under surveillance and new analyses are run each year.

Test validity studies have been developed in various ways: first, content validity of items was established by test developers, then construct validity was determined by test battery intercorrelation. Predictive validity was established by correlating test scores and teachers' grades. Results of these studies are reported in Tables I and II. Continuing research is being done for these tests and new instruments as they are developed. A study of teacher characteristics and student success is briefly discussed on page 14 of this manual.

TABLE I

TRADE AND INDUSTRIAL TEST VALIDITY

### RELIABILITY

The Spearman - Brown formula ( $r_{tt} = \frac{2r_{oe}}{1+r_{oe}}$ ) was used to determine test

reliability. (1) The student sample consisted of Ohio high school juniors and seniors who were involved in the T and I test validation studies. Test reliability scores give some indication of the confidence which a test user may place in a given test; however, the standard error of measurement is usually more us able in indicating how adequately an obtained score represents a true score. Table III presents T and I reliability coefficients, means and standard deviations for Ohio juniors and seniors.

(1) Downie, N.M. and R.W. Heath, <u>Basic Statistical Methods</u>, Harper and Brothers, 1959.

TABLE III

MEANS, STANDARD DEVIATIONS, AND RELIABILITY COEFFICIENTS

Seniors	110	168.98	47.41	. 97

Based on Ohio students tested in 1964.

### THE STANDARD ERROR OF MEASUREMENT

The standard error of measurement helps a test interpreter determine the size of a discrepancy in a test score of an individual. The formula:(2)

$$r_t \infty = \sigma_t \sqrt{1 - r_{tt}}$$

is used to find the standard error of measurement for the Ohio T and I tests.

An estimate of the dispersion of a group of obtained scores from corresponding true scores are reported as the S. E.  $_{m}$  for T and I tests on the following table.

OHIO TRADE AND INDUSTRIAL ACHIEVEMENT TEST
STANDARD ERROR OF MEASUREMENT

TRADE	N	STANDARD ERROR OF MEASUREMENT (S.E. m)
Machine Trades	483	7.25
Automotive Mechanics	384	7.71
Basic Electricity	244	7.16
Basic Electronics	263	4.60
Mechanical Drafting	149	7.69
Printing	110	8.71

Based on Ohio students tested in 1964.

### RECENT RESEARCH

A study was conducted to evaluate teaching and learning in Ohio T and I programs. The specific areas of inquiry dealt with (1) the teacher, his background and preparation (2) the relationship between amount of money spent per student and quality programs (3) the local supervisor's rating as a descriptive evaluation of quality programs (4) the self concept characteristics of T and I teachers (5) the differences that exist between specific areas of many T and I programs and (6) the factors that appear to be significant in quality programs.

Students involved in this study were juniors and seniors in selected Ohio schools. The number who satisfied the established criteria was over 5000. This sample was involved in the teacher characteristic and the financial study. Approximately 2200 students were involved in quality program evaluation. All students were from schools with approved Ohio Trade and Industrial programs. The (325-350) teachers in this study were involved in the instructional process of the above mentioned students.

Local supervisors of approved Ohio T and I programs received the instruments used in this evaluation. The instruments were: (1) Expenditure Analysis (2) Teacher Rating Sheet (3) Teacher Background and Preparation and (4) The Opinion, Attitude and Interest Survey.

Significance of difference tests were performed between groups. T and I areas were ranked 1 - 16 on all scales in this analysis, and were compared descriptively by this ranking throughout the report.

The criterion regarding student success in the study was the Ohio T and I achievement tests. More information concerning this research, the findings and implications for continued study of students, teacher behavior, facilities and other factors may be obtained by contacting the Instructional Materials Laboratory, The Ohio State University, Columbus.

### **TEST ADMINISTRATION**

The Ohio Trade and Industrial Education Achievement Tests are given near the end of each school year. The trade test, the California Survey of Mental Maturity and the computation section of the Stanford Arithmetic Test are to be taken by each student. These tests prove to be quite valuable in identifying students' mental maturity and arithmetic grade placement.

### First Day of Testing (Allow 1-1/2 hours)

The Survey of Mental Maturity and the Stanford Arithmetic are to be given the same day. The Survey of Mental Maturity is a timed test and requires 30 minutes. The two sections of this test, Non-Language and Language, require 15 minutes each. A mark-sense answer card is used for the Survey of Mental Maturity examination.

The Stanford Arithmetic Test is a timed test and will require 35 minutes. Only the computational section of the test will be used.

### Second Day of Testing (Allow 1-1/2 to 3 hours, depending upon tests being taken)

The Ohio Trade and Industrial Education Achievement Tests are power tests, and students should be allowed to complete all items. The following list of tests and their approximate times should be studied prior to scheduling. All students will take both parts of a test. NOTE: Basic Electricity and Basic Electronics are separate tests and are NOT divided into PARTS.

Machine Trades Achievement Test, Part I	3 hours
Automotive Mechanics Achievement Test, Part I	1-1/2  hrs.
Basic Electricity Achievement Test	3 hours
Mechanical Drafting Achievement Test, Part I	3 hours
Printing Achievement Test, Part I	2-1/2  hrs.
Sheet Metal Achievement Test, Part I	3 hours

### Third Day of Testing (Allow 1-1/2 to 3 hours, depending upon tests being taken)

The Ohio Trade and Industrial Education Achievement Tests are power tests and students need sufficient time to complete all items. The following lists of tests and their approximate times should be studied prior to scheduling. All students who have taken Part I of an achievement test should be scheduled for Part II.

Machine Trades Achievement Test, Part II	3 hours
Automotive Mechanics Achievement Test, Part II	1-1/2 hrs.
Basic Electronics Achievement Test	1-1/2  hrs.
Mechanical Drafting Achievement Test, Part II	3 hours
Printing Achievement Test, Part II	1-1/2  hrs.
Sheet Metal Achievement Test, Part II	3 hours

### Administrators of the Test

Test materials are handled entirely by the test administrator. Instructors are not to review or have access to the tests. This is a precaution to protect the validity of the tests, since a purpose of the tests is to improve instruction. Instructors are aware that the value and purpose of the test is lost if they have reviewed the questions and have prepared the students for specific questions or sections of the test.

All test books, answer cards, and other test materials are to be returned on the last day the tests are given.

### APPENDIX A

### TEST PROFILE NORMS

The following percentile profile sheets for the trades were developed from Ohio seniors tested in 1964. The California Survey of Mental Maturity and the Stanford Arithmetic Achievement Test scores are located on the top lines of each sheet. These norms are made from the actual sample tested. The intended use of the sheets is illustrated in the Hypothetical Case which permits the student to identify his achievement within the state norms and the school median.

- a. Machine Trades
- b. Automotive Mechanics
- c. Basic Electricity
- d. Basic Electronics
- e. Mechanical Drafting
- f. Printing
- g. Sheet Metal
- h. Hypothetical Case

### Percentile Norm Sheets:

Listed to the left side of each percentile norm sheet are the tests and their subtests. The top three lines refer to the California Survey of Mental Maturity and its two sections (Non-language and Language). The fourth line is the Stanford Arithmetic total test score for the computational section. This is then followed by the total score for the trade test. The various sections of this test complete the listing.

The numbers in alignment with the test or its sections are raw scores. These scores are in a percentile distribution, reading from the 1st percentile to the 99th percentile. (See numbers immediately below "Percentile Norms.") The 50th percentile represents the median for the state.

### REPORTING TEST RESULTS

A hypothetically plotted percentile norm chart showing how the charts can be effectively used is illustrated on the following page. Referring to the chart, it will be noted that the school's median scores are listed on the extreme left, giving the school median score for each test total, and for each section of each test. At the extreme right is listed a student's scores. By plotting the school median scores in red, and the student's scores in black (or another color), the profile shows how the school compares with the state as a whole, and how the student ranks both with his class and the state. A chart is provided for each student.

# FOR PLOTTING BOTH SCHOOL AND STUDENT HYPOTHETICAL CASE -

### **APPENDIX B**

### SCHOOLS PARTICIPATING

The next pages contain a partial listing of schools which have participated in the Ohio Trade and Industrial Education Testing Program. These schools are listed by states in the following order:

- a. Ohio Schools
- b. Illinois Schools
- c. Indiana Schools
- d. Kentucky Schools
- e. West Virginia Schools
- f. Delaware Schools
- g. Utah
- h. District of Columbia
- i. National Printing Study

The schools contained in this listing participated in a National Study using the Printing Trades in 1966. For additional information concerning this study write to:

The Instructional Materials Laboratory The Ohio State University 1885 Neil Avenue Columbus, Ohio 43210
